

Syllabus and Course Scheme
Academic year 2015-16

M.Sc. – Physics .
Exam. – 2016

UNIVERSITY OF KOTA
MBS Marg, Swami Vivekanand Nagar,
Kota - 324 005, Rajasthan, India
Website: uok.ac.in

Scheme:

The examination will be conducted for two days, 6-hrs.each day. The distribution of the marks will be as follows:

a.	Two experiments	125 marks	
b.	Record	25 marks	
c.	Viva-voce	25 marks	
d.	Seminar	25 marks	
	Total -		200 marks
	Minimum Pass Marks		72 marks

(write up with references are to prepared and submitted during exam.)

M.Sc.(P)

Paper 1-Classical Mechanics and Mathematical Methods in Physics

Paper-II-Classical Electrodynamics

Paper III-Quantum Mechanics and Atomic & Molecular Physics

Paper-IV Electronics, Numerical Methods and Computer Programming
Practical

M.Sc.(F)

Paper-: V- Advanced Quantum Mechanics & Quantum field Theory

Paper-: VI – Nuclear Physics

Paper-: VII- Solid state Physics

Paper –VIII (A) Microwave Electronics

OR

Paper VIII (B)-High Energy Physics

OR

Paper VIII- (C) Solid State Electronics

Practical

M.Sc. (P) Physics -2016

Paper 1-Classical Mechanics and Mathematical Methods in Physics

Max. Marks: 100

Duration: 3 hrs.

Note- The question paper will contain three sections as under-

Section-A: One compulsory question having 10 parts with 02 parts from each unit, short answer in 20 words for each part.

Total marks: 10

Section-B: 10 questions, 02 question from each unit, 05 questions will be attempted, taking one from each unit, answer approximately in 250 words.

Total marks: 50

Section-C: 04 questions (question may have sub division) covering all units but not more than one question from each unit, descriptive type, answer in about 500 words, 02 question to be attempted.

Total marks: 40

UNIT-I

Holonomic and non-holonomic constraints, D'Alembert's principle, generalized coordinates. Lagrangian, Lagrange's equation and its applications, velocity dependent, potential in Lagrangian formulation, generalized momentum, Legendre transformation, Hamiltonian, Hamilton's Canonical equation, calculus of variation and its application to simple problems, Hamilton's variational principle.

UNIT-II

Derivation of Lagrange's and Hamilton's canonical equations from Hamilton's variational principle, extension of Hamilton's principle to non-conservative and non-holonomic systems, method of Lagrange's multipliers, conservation principle and Noether's theorem, conservation of energy, linear momentum and angular momentum as a consequence of homogeneity of time and space and isotropy of space respectively.

UNIT-III

Canonical transformation, Integral invariants of Poincare, Lagrange's and Poisson brackets as canonical invariants, Equation of motion in Poisson bracket formulation, Infinitesimal canonical transformation and generators of symmetry, Liouville's theorem, Hamilton Jacobi equation and its applications.

Action-angle, variables adiabatic invariance of action angle variables, Kepler problem in action angle variables, theory of small oscillations in Lagrangian formulation, normal coordinates and its application, orthogonal transformation, Eulerian angles, Euler theorem, eigen values of the inertia tensor, Euler equations, Force free motion of rigid body.

UNIT-IV

Fourier transforms: Fourier integrals, Fourier's transform and inversion theorem, Falting theorem, application of integral transforms to pulse propagation, Discrete Fourier transform, Fast Fourier transform, Laplace transform, Laplace transform of derivatives and integrals, derivatives integrals of Laplace transform, Laplace transform of periodic function, inverse Laplace transform, convolution theorem, impulsive functions, application of Laplace transform in solving linear differential equation with constant coefficients and with variable coefficients, linear partial differential equations.

UNIT-V

Analytic functions, Cauchy-Riemann conditions, Harmonic function, elementary complex functions and their properties, mapping Z and Z complex integration, definite integrals, Cauchy Goursat's theorem, Cauchy integral theorem, Indefinite integrals, Cauchy integral formula, Morera's theorem, Fundamental theorem of algebra, analytic continuation, branches of multi valued function.

Taylor's series, Laurent's series, integration and differentiation of power series, zeros of analytic functions, singular point, residues, Cauchy residue theorem, poles evaluation of improper integrals, Jordan's lemma, integration around a branch point, multi valued functions.

8. Mathematical Physics: A. Ghatak (McMillan)

Paper-II-Classical Electrodynamics

Max. Marks: 100

Duration: 3 hrs.

Note- The question paper will contain three sections as under-

Section-A: One compulsory question having 10 parts with 02 parts from each unit, short answer in 20 words for each part.

Total marks: 10

Section-B: 10 questions, 02 question from each unit, 05 questions will be attempted, taking one from each unit, answer approximately in 250 words.

Total marks: 50

Section-C: 04 question (question may have sub division) covering all units but not more than one question from each unit, descriptive type, answer in about 500 words, 02 question to be attempted.

Total marks: 40

UNIT-I

Electrostatics: Electric field, Gauss law, differential form of Gauss law, Curl of electric field and the scalar potential, surface distribution of charges and dipoles and discontinuities in the electric field and potential, Poisson and Laplace equations, Green's theorem, uniqueness of the solution with Dirichlet or Neumann boundary conditions, formal solution of the electrostatics boundary value problem with Green's function, Electrostatics potential energy and energy density, capacitance.

Boundary Value Problems in Electrostatics: Method of images, point charge in the presence of a grounded conducting sphere, point charges in the presence of a charged insulated conducting sphere, point charges near a conducting sphere at a fixed potential, conducting sphere in an uniform electric field by method of images, Green function for the sphere, general solution for potential, conducting sphere with Hemispheres at different potential, orthogonal functions and its expansion.

UNIT-II

Multipoles, Electrostatics of Macroscopic Media Dielectrics: Multipole expansion of potential multipole expansion of the energy of a charge distribution in an external field, elementary treatment of electrostatics with permeable media, boundary value problems with dielectrics, molecular polarizability and electric susceptibility, models for molecular polarizability, electrostatic energy in dielectric media.

Magnetostatics: Differential equation of Magnetostatics and Ampere's law, vector potential and magnetic induction for a circular current loop, magnetic field of a localized current distribution, magnetic moment, force and torque on and energy of a localized current distribution in an external magnetic field, macroscopic equations, boundary conditions on B & H, methods of solving boundary value problems in magnetostatics, uniformly magnetized sphere in an external field, permanent magnetic shielding, spherical shell of permeable material in an uniform field.

UNIT-III

Time Varying Fields, Maxwell's Equations, Conservation Laws: Energy in a magnetic field, vector and scalar potential, Gauge transformations, Lorentz Gauge, Coulomb Gauge, Green functions for the wave equation, derivation of the equations of macroscopic electromagnetism, Poynting's theorem and conservation of energy and momentum for a system of charged particles and E.M. fields, conservation laws for macroscopic media.

Plane Electromagnetic Waves and Wave Equation: Plane wave in a nonconducting medium, frequency dispersion characteristics of dielectrics, conductors and plasmas, waves in a conducting or dissipative medium, superposition of waves in one dimension, group velocity, Causality in the connection between D and E, Kramers-Kronig relation.

Unit-IV

Magneto Hydrodynamics and Plasma Physics: Introduction and definitions, MHD equations, magnetic diffusion, viscosity and pressure, pinch effect, instabilities in a pinched plasma column, magneto hydrodynamic waves, plasma oscillations, short wavelength limit on plasma oscillations and Debye shielding distance.

Covariant form of Electromagnetic Equations: Mathematical properties of the space time of special relativity, invariance of electric charge, covariance of electrodynamics, transformation of electromagnetic field.

Unit-V

Radiation by Moving Charges: Lienard-Wiechart potentials for a point charge, total power radiated by an accelerated charge, Larmor's formula and its relativistic generalization, angular distribution of radiation emitted by an accelerated charge, radiation emitted by a charge in arbitrary extremely relativistic motion, distribution in frequency and angle of energy radiated by accelerated charges, Thomson scattering and radiation, scattering by quasi free charges.

Scattering and dispersion:-Introductory considerations, radiative reaction force from conservation of energy, Abraham Lorentz evaluation of the self force, difficulties with Abraham Lorentz model, integral-differential equation of motion including radiation damping, line breadth and level shift of an oscillator, scattering and absorption of radiation by an level shift of an oscillator, scattering and absorption of radiation by an oscillator, energy transfer to harmonically bound charge.

Paper III-Quantum Mechanics and Atomic & Molecular Physics

Max. Marks: 100

Duration: 3 hrs.

Note- The question paper will contain three sections as under-

Section-A: One compulsory question having 10 parts with 02 parts from each unit, short answer in 20 words for each part.

Total marks: 10

Section-B: 10 questions, 02 question from each unit, 05 questions will be attempted, taking one from each unit, answer approximately in 250 words.

Total marks: 50

Section-C: 04 questions (question may have sub division) covering all units but not more than one question from each unit, descriptive type, answer in about 500 words, 02 question to be attempted.

Total marks: 40

UNIT-I

States Amplitudes and Operators: States of a quantum mechanical system, Bra and Ket Algebra, representation of quantum mechanical states, properties of quantum mechanical amplitude, operators and change of state of a complete set of basic states, product linear operators, language of quantum mechanics, postulates, essential definition and consequent relations.

Observable and Description of Quantum System: Process of measurement, expectation values, time dependent of a quantum mechanical amplitude, Observables with no classical analogue, Spin dependence of quantum mechanical amplitude on position, the wave function, superposition of amplitudes, Identical particles, creation and annihilation operators, simple harmonic oscillator.

Hamiltonian Matrix and time evolution of quantum mechanical states:-Hermiticity of the Hamiltonian Matrix, Time independent perturbation of an arbitrary system, Simple matrix examples of time independent perturbation, Energy eigen states of two state system, Diagonalizing of energy matrix, Time independent perturbation of a two state system, Perturbative solution: weak field and strong field cases, General description of a two state system, Pauli matrices, Ammonia molecule as an example of two state system, asymmetric harmonic oscillator.

Unit -II

Transition Between Stationary States: Transition in two state system, Time dependent perturbation-The Golden rule, Phase space, Emission and absorption of radiation, Induced dipole transition and spontaneous emission of radiation, Energy width of a quasi stationary state.

The Co-ordinate Representation: Compatible observable, quantum conditions and uncertainty relations, co-ordinate representation of operators: position, momentum and angular momentum, time dependence of expectation values, The Schrodinger equation, energy quantization, periodic potential as an example.

UNIT-III

Hydrogen Atom: Gross structure energy spectrum probability distribution of radial and angular ($l=1, 2$), Wave functions (no derivation), Effect of spin, relativistic correction to energy levels and fine structure, magnetic dipole interaction and hyperfine structure, the Lamb shift (only a qualitative description).

Interaction with External Fields: Non degenerate first order stationary perturbation methods, Atom in a weak uniform external electric field and first and second order Stark effect, Calculation of the polarizability of the ground state of H-atom and of an isotropic harmonic oscillator, Degenerate stationary perturbation theory, Linear Stark effect for H-atom levels, Inclusion of spin orbit and weak magnetic field, Zeeman effect, Strong magnetic field and calculation of interaction energy.

UNIT-IV

Symmetries and Angular Momentum: Symmetry transformation and conservation laws, Invariance under space and time translations and space rotation; Conservation of momentum, energy and angular momentum.

Angular momentum operators and their eigen values, Matrix representation of angular momentum operators and their eigen states, Coordinate representation of the orbital angular momentum operators and their eigen states (spherical harmonics), Composition of angular momentum. Clebsch-Gordon coefficient, Tensor operators and Wigner Echart theorem, Commutation relations J_+ , J_- and J with

reduced spherical tensor operator, Matrix elements of vector operators, Time reversal invariance and vanishing of static electric dipole moment of stationary state.

Unit-V

Systems with Identical Particles: Indistinguishability and exchange symmetry, Many particles wave function and Pauli's exclusion principle, Spectroscopic terms for atoms, The Helium atom, Variational method and its use in the calculation of ground state and excited state energy, Helium atom, Hydrogen molecule, Heitler London methods for H₂ molecule, WKB method for one dimensional problem, Application to bound states (Bohr Sommerfield quantization) and the barrier penetration (Alpha decay problems).

Spectroscopy (Quantitative): General feature of spectra of one and two electron system, Vibration band spectrum of a molecule, P.Q & R branches, Raman spectra for rotational and irrotational transitions, comparison with infrared spectra, General features of electronic spectra, Frank Condon principle.

Paper-IV Electronics, Numerical Methods and Computer Programming

Max. Marks: 100

Duration: 3hrs

Note- the question paper will contain three sections as under-

Section-A: One compulsory question having 10 parts with 02 parts from each unit, short answer in 20 words for each part.

Total marks: 10

Section-B: 10 questions, 02 question from each unit, 05 questions will be attempted, taking one from each unit, answer approximately in 250 words.

Total marks: 50

Section-C: 04 questions (question may have sub division) covering all units but not more than one question from each unit, descriptive type, answer in about 500 words, 02 question to be attempted.

Total marks: 40

Unit-I

Linear Small Signal and Direct Coupled Amplifier:-R.C. Coupled C.E. Amplifier and its response in different frequency ranges, effect of cascading expression of bandwidth in low and high frequency ranges, emitter follower, tuned amplifier (small signal) single and double tuned amplifiers, Differentials amplifier, common mode rejection ratio, operational amplifier and its basic applications.

Wave Shaping Circuits: Exponential circuit response, differentiation and integration by R.C. and L.R circuits, clipping or limiting circuit, clamping circuit, general feature of a time base signal, thyatron sweep circuits, circuits to improve linearity, Miller and Boot strap sweep circuits.

Unit-II

Logic and Integrating Circuits: Boolean algebra, binary counting, counting to a base other than two, binary counter, conversion of binary counter in a decade counter, Decoder, logic gates : NOT, OR, AND, NAND and their circuits, Micro electronic devices, basic principles of LED & solid state laser. basic concepts about fabrication and characteristics of integrated circuits.

Multivibrators: Astable, monostable, and bistable multivibrators, frequency of a stable vibrator, frequency control and synchronization, triggering of bistable, Blocking oscillator.

Unit-III

Errors in Numerical Analysis: - Computer arithmetic, sources of errors, Round off errors, Errors analysis, Condition and stability, Approximation, functional and errors analysis, The method of Undetermined coefficients.

Interpolation:- Interpolation, Finite differences, Gauss central difference formula, Newton's formula for interpolation, Lagrange's interpolation formula, Double interpolation, Numerical differentiation, Newton and Starling's formula, Solution of linear systems, Direct and iterative, Eigen value problems.

Unit-IV

Solution of Non-Linear Equation: Bisection method, Newton's Method, Modified Newton's method, Method of integration, Newton's method and method of integration for a system of equations, Newton's method for the case of complex roots, Integration of functions: Trapezoidal and Simpson's rules, Gaussian quadrature formula, singular integrals, Double integration.

Unit-V

Integration of Ordinary Differential Equation:- Predictor Corrector method, Runge-Kutta methods, Simultaneous and higher order equations, Numerical integration and differentiation of Data, Least squares approximation, computer simulation, Monte Carlo method, Curve fitting.

BASIC: Variable expressions, jumping, branching and looping statements, input/output statements, sub-routing commands for plotting a graph statement for handling input /output files, programming of simple problems.

OR

FORTRAN 77/90: Variable expressions, Jumping, branching and looping statement for handling input/output files, Sub-routine, External function, Special statements COMMON, ENTRY, FORMAT, PAUSE, EQUIVALENCE, Programming of simple problems.

7. Introductory Methods of Numerical Analysis : S.S. Sastry
8. A first course in Numerical Analysis : A. Ralston & P. Rabinowitz (McGraw Hill-1985)

List of Experiments :

1. Use of Michelson's Interferometer to determine:
 - i. Wave length of monochromatic light.
 - ii. D_1 for sodium doublet.
 - iii. Thickness of the given mica sheet.
2. Use Fabry parot's interferometer to determine:
 - i. Wave length of sodium light.
 - ii. D_1 for sodium doublet.
3. Verify Fresnel's Laws.
4. Determine the wavelength of Neon light taking Hg source as a standard source applying Hartman's formula.
5. Use Bebinat's compensator,
 - i. To analyze elliptically polarized light.
 - ii. To determine the phase difference introduced between ordinary & extraordinary rays.
6. Determine Stefan's constant.
7. Design a Double stage R.C. Couped amplifier and study:
 - i. Frequency response.
 - ii. The amplitude characteristics.
8. Determine the capacitance, resistance and inductance of a coil at radio frequency and to study the variations of Z with frequency
9. Determine the μ , g_m & r_p of a triode by bridge method and study the variation of these quantities with grid voltage
10. Study the series and parallel response circuit:
 - (i). To plot the frequency response curve characteristics of series circuit.
 - (ii). To plot the frequency response of parallel tuned circuit.
11. To design and study the frequency response of a cathode power.
12. To study the waveform characteristics of a stable multivibrator.
 - (i) To design C.R.O. and determine its frequency by varying C&R.
13. To design and calibrate a Hartley Oscillator.
14. To study frequency response of phase characterstics of:
 - (i) Low pass filter.
 - (ii) High pass filter.
15. To design & study the Dynatron oscillator.
16. Any other experiment of equivalent standard can be added.

M.Sc. (F) Physics - 2016

Paper-: V- Advanced Quantum Mechanics & Quantum field Theory

Duration:-3hrs

Marks:- 100

Note: - The question paper will contain three sections as under-

Section-A: One compulsory question having 10 parts with 02 parts from each unit, short answer in 20 words for each part.

Total marks: 10

Section-B: 10 questions, 02 question from each unit, 05 questions will be attempted, taking one from each unit, answer approximately in 250 words.

Total marks: 50

Section-C: 04 questions (question may have sub division) covering all units but not more than one question from each unit, descriptive type, answer in about 500 words, 02 question to be attempted.

Total marks: 40

Unit-I

Scattering (Non-relativistic):- Differential and total scattering cross section, solution of scattering problem by the method of partial wave analysis, expansion of a plane wave into a spherical wave and scattering amplitude, optical theorem applications: scattering from the delta potential, square well potential and hard sphere, scattering of identical particles, energy dependence and resonance scattering, Breit Wigner formula, quasi stationary state, Lippman Schwinger equation and the Green's function approach for scattering problem, Born approximation and its validity for scattering problem, Coulomb scattering problem under first Born approximation in elastic scattering.

Unit-II

Relativistic Formulation and Direct equation: Attempt for relativistic formulation of quantum theory, Klein-Gordon equation, probability density and probability current density, solution of free particle K.G. equation in momentum representation, interpretation of negative probability energy solutions, Dirac equation for a free particle, properties of Dirac matrices and algebra of gamma matrices, non-relativistic correspondence of the Pauli equation (inclusive of electromagnetic interaction), Solution of the free particle, Dirac equations, orthogonality & completeness relation for Dirac spinors, interpretation of negative energy solutions & hole theory.

Unit-III

Symmetries of Dirac Equation: Lorentz boost, Lorentz covariance of Dirac equation, Proof of covariance & derivation of Lorentz transformation matrix and rotation matrices for Dirac spinors, projection operators involving four momentum & spin, parity (P), charge conjugation (C), time reversal (T) and CPT operators for Dirac spinors, bilinear covariant and their transformation behavior under Lorentz transformation, P, C, T & CPT, expectation values of coordinate & velocity involving only positive energy solutions, Zitter Bewegung, Klein paradox.

Unit-IV

Photon as a quantum mechanical excitations of radiation field, fluctuations and the uncertainty relation, validity of classical description, matrix element for emission and absorption, spontaneous emission in the dipole approximation, Rayleigh scattering, Thomson scattering & Raman effect, Radiation damping & resonance fluorescence.

Quantum Field Theory:- Scalar and vector fields, Classical Lagrangian field theory, Euler Lagrange's equation, Lagrangian density for electromagnetic field, occupation number representation for simple harmonic oscillator, linear array of coupled oscillators, second quantization of systems of identical bosons, second quantization of real Klein-Gordon field and complex Klein-Gordon field, meson propagator, second quantization of systems of identical bosons.

Unit-V

Occupation number representation for Fermions, second quantization of the Dirac field, Fermion propagator the e. m interaction & gauge invariance, covariant quantization of the free electromagnetic field, photon propagator.

S-Matrix: S-matrix expansion, Wick's theorem, diagrammatic representation in configuration space, momentum representation, Feynman rules of QED, Feynman diagrams of basic processes, Application of s-matrix formalism, Coulomb scattering, Bhabha scattering, Moller scattering, Compton scattering and Pair production.

Paper:- VI – Nuclear Physics

Duration:-3hrs

Marks:-100

Note:- - The question paper will contain three sections as under-

Section-A: One compulsory question having 10 parts with 02 parts from each unit, short answer in 20 words for each part. **Total marks: 10**

Section-B: 10 questions, 02 question from each unit, 05 questions will be attempted, taking one from each unit, answer approximately in 250 words. **Total marks: 50**

Section-C: 04 questions (question may have sub division) covering all units but not more than one question from each unit, descriptive type, answer in about 500 words, 02 question to be attempted. **Total marks: 40**

Unit-I

Two Nucleon System and Nuclear Forces: General nature of the force between nucleons, saturation of nuclear force, charge independence & spin dependence, general forms of two nucleon interaction, central, non-central & velocity dependent potential, analysis of the ground state ($3S_1$) of deuteron using a square well potential, range depth relationship, excited states of deuteron, discussion of the ground state of deuteron under non central forces.

Unit-II

Nucleon-Nucleon Scattering & Potentials: Partial wave analysis of two neutron-proton scattering at low energy assuming a central potential with square well shape, concept of the scattering length, Coherent scattering of neutrons by protons in (ortho & para) hydrogen molecule, conclusion of these analysis regarding scattering lengths, range & depth of the potential, effective range theory (in neutron-proton scattering) and shape independence of nuclear potential, A qualitative discussion of proton-proton scattering at high energy, hard core potentials and Red hard core and soft core potentials, main features of the One Boson Exchange Potential (OBEP) (no derivation).

Unit-III

Nuclear shell Model: Single particle & collective motions in nuclei, assumption & justification of the shell model, average shell potential, spin orbit coupling, single particle wave functions and level sequence, magic numbers, shell model predictions for ground state parity, angular momentum and their comparison with experimental data, configuration mixing, single particle transition probability according to the shell model, selection rules, approximate estimates for transition probability and Weisskopf units, nuclear isomerism.

Collective nuclear models: Collective variables to describe the collective models of nuclear motion, Parameterization of nuclear surface, A brief description of the collective model Hamiltonian (in the quadratic approximation), vibrational modes of spherical nuclei, collective modes of deformed even-even nucleus and moments of inertia, collective spectra and electromagnetic transitions in even nuclei and comparison with experimental data, Nilsson model for the single particle states in deformed- nuclei.

Unit-IV

Nuclear Gamma & Beta Decay: Electric & Magnetic multipole moments and gamma decay probabilities in nuclear system (no derivation), reduced transition probability, selection rules: internal conversion & zero-zero transition.

General characteristics of weak interactions, Nuclear beta and lepton capture, electron energy spectrum and Fermi-Kurie plot. Fermi theory of beta decay (parity conserved selection rules Fermi and Gamow Teller) for allowed transition : ft-values, general interaction Hamiltonian for beta decay with parity conserving and non conserving terms, forbidden transition, experimental verification of parity violation.

Nuclear Reactions: Theories of nuclear reactions, partial wave analysis of reaction cross section: compound nucleus formations & break-up, resonance, scattering & reaction, Breit Wigner dispersion formula for S-Wave ($l=0$), continuum cross section: statistical theory of nuclear reactions, evaporation probability and cross section for specific reactions, electric quadruple & magnetic dipole moments, state mixture.

The optical model, stripping and pickup reactions and their simple theoretical description (Butler Theory) using plane wave Born approximation (PWBA), short comings of PWBA, nuclear structure studies with deuteron proton stripping (d,p) reaction.

Unit-V

Interaction of Neutrons, EM Radiation and Charged Particles with Matter: Law of absorption and attenuation coefficients, slowing down & law for neutron capture photoelectric effect, Compton Scattering, pair production, Klein Nishima cross section for polarized & unpolarized radiation, angular distribution of scattered photon & electrons, energy loss of charged particles due to ionization, Bremsstrahlung energy, target and projectile dependence of all three processes range energy curves straggling.

Experimental techniques: Gas filled counters, BF counter, scintillation counters, solid state detectors, surface barrier detectors, neutron activation detector, electronic circuits used with typical nuclear detector properties, chambers Nuclear emulsions techniques of measurement and analysis of tracks, proton synchrotron, electron accelerator and neutron generators, acceleration of heavy ions.

Paper:- VII- Solid state Physics

Duration:-3hrs

Marks:-100

Note:- - The question paper will contain three sections as under-

Section-A: One compulsory question having 10 parts with 02 parts from each unit, short answer in 20 words for each part.

Total marks: 10

Section-B: 10 questions, 02 question from each unit, 05 questions will be attempted, taking one from each unit, answer approximately in 250 words.

Total marks: 50

Section-C: 04 questions (question may have sub division) covering all units but not more than one question from each unit, descriptive type, answer in about 500 words, 02 question to be attempted.

Total marks: 40

Unit -I

Lattice Vibrations and Thermal Properties: Lattice specific heat, theoretical estimates of Einstein and Debye temperatures, Wave mechanics of phonons, Creation and annihilation operators, Elastic waves and lattice vibration in one dimensional crystal, Long range forces and the reciprocal lattice method, Lattice vibration of a diatomic linear chain, Dispersion relation for three dimensional crystals, Born-Von Karmon boundary conditions and density of states, Experimental observation of phonon frequencies, equation of state of the crystal lattice, Thermal Conductivity of insulators.

Unit-II

Theory of Metals: Fermi Dirac Distribution Function, density of states, temperature dependence of Fermi energy, Specific heat, Boltzmann equation and mean free path, relaxation time and scattering processes, thermal conductivity and electrical conductivity (using F-D statistics). Widemann- Franz ratio, susceptibility, Drude's theory of light absorption in metals, Hall effect.

Band theory of metals: Bloch theorem, Kronig-penny model, Effective mass of electrons. Wigner-seitz approximation, nearly free electron model, tight binding method and calculation of density of states for S-band in simple cubic lattice, Cyclotron Resonance and Hall effect, de-Hass van Alphen effect, Experimental methods in determination of band structure, Limitations of band theory.

Unit-III

Semiconductors: Law of mass action, calculation of impurity conductivity, ellipsoidal energy surfaces in Si and Ge, Hall effect recombination mechanism, Optical transitions and Shockley Read theory, excitons, photoconductivity, photo luminescence.

Nano-Science and Nano-Technology: Introduction to nano-science, nano-technology and nano-materials, evolution of nano-technology from micro-technology.

Imperfection in solids: Point, line planer and defects, colour centers, F-Centre and aggregate centers in alkali halides, John Teller effect, Single crystal growth, crystal whiskers.

Unit-IV

Magnetism: Larmor diamagnetism, paramagnetism, Curie Langevin classical theory, Quantum theory of paramagnetism, susceptibility of rare and transition metals, Ferromagnetism: Weiss theory Quantum theory of Ferromagnetism, origin of domains, Bloch Walls, Anti ferromagnetism, Ferrites, Magnons, magnetic resonance, Nuclear magnetic resonance, magnetic materials.

Superconductivity: Electromagnetic Properties, Thermal properties, isotope effect and electron phonon interaction, microscopic theory of superconductivity, Mc Millan's formula (no derivation), High temperature superconductivity in cuprates, fullerenes (basic ideas), Organic super conductors (basic ideas), Superconducting tunneling, application of super conductivity.

Unit-V

Quantum Statistics and Elementary Excitations of Electron Gas: Simple harmonic oscillator, Annihilation and creation Operators, coupled oscillators, linear chain, Bosons, Fermions, second Quantization, Hamiltonian for two particles, Fermions Boson Interaction, Landau theory of Fermi liquids.

Group theory: Group. Group Multiplications table, Representation of group (i) Representation of the triangle group (ii) Representation of the space group of a crystal.(iii) Normal modes of vibration of O₃ molecule.

Paper –VIII (A) Microwave Electronics

Duration:-3hrs

Marks:-100

Note:- - The question paper will contain three sections as under-

Section-A: One compulsory question having 10 parts with 02 parts from each unit, short answer in 20 words for each part.

Total marks: 10

Section-B: 10 questions, 02 question from each unit, 05 questions will be attempted, taking one from each unit, answer approximately in 250 words.

Total

marks: 50

Section-C: 04 questions (question may have sub division) covering all units but not more than one question from each unit, descriptive type, answer in about 500 words, 02 question to be attempted.

Total marks: 40

Unit-I

Wave guides: Rectangular wave guides; wave equation and its solutions, TE & TM Modes, Dominant mode & choice of wave-guide dimension, methods of excitation wave-guide. Circular wave-guide : wave equations and its solutions (TE, TM & TEM modes), Causes of attenuation in wave guides, wall current & derivation of attenuation constant, Q of the wave guide.

Resonators (a) Resonant modes of rectangular & cylindrical cavity resonator of the cavity resonator frequency meter, (b) Ferrites: Microwave propagation in ferrites, Faraday rotation, Device employing Faraday rotation (Isolator Gyrator, circulator).

Unit-II

Microwave antennas: Magnetic currents, Electromagnetic current sheets, field of Huygen's source, radiation from a slot antenna, open end of a wave guide & electromagnetic horns, Radiation field of Micro strips wave guide, microstrip antenna calculations, Microstrip design formulas.

Microwave tubes: Space charge spreading of an electron beam, beam focusing, Klystron: Velocity Modulation, Two cavity Klystron, Reflex Klystron, Efficiency of Klystron, Magnetron-Types and description, theoretical relation between electric & magnetic field of oscillation, Modes of oscillation, & operating characteristics, Travelling wave tubes O & M type travelling wave tubes.

Unit-III

(a) Avalanche transit time Device: Read diode, Negative resistance of an avalanching P-N diode IMPATT oscillator.

(b) Transferred Electro Device: Gunn effect, Two valley model, high field domains, different modes for microwave generation.

Parametric Amplifier: Varactor, Equation of capacitance in linearly graded & abrupt P-N junction, Manley –Rowe relations, parametric up converter and negative resistance parametric amplifier, use of circulator, Noise in parametric amplifier.

Unit-IV

Microwave measurement: Power, frequency, Attenuation, Impedance (use of smith Chart) VSWR Directivity, Coupling Reflectometer, complex permittivity of materials and its measurements. Definition of complex permittivity, loss tangent-their importance and correlation, Measurement of complex permittivity of solids, liquids and powder, using shift of minima method, Introduction to frequency perturbation method & Hestenet method of evaluate complex permittivity of materials.

Unit-V

Microwave filters: Basic theory, Quarter wave & direct coupled cavity filters.

Passive Device: Termination (short circuit & matched termination) Attenuator, Phase changers E & H plane Tees, hybrid junctions, Directional coupler.

Monolithic Micro Wave Integrated Circuits: Substrate materials, Conductor materials, Dielectric & resistance films, Fabrication techniques, monolithic integrated circuits.

Paper VIII (B)-High Energy Physics

Duration:-3hrs

Marks:-100

Note-: - The question paper will contain three sections as under-

Section-A: One compulsory question having 10 parts with 02 parts from each unit, short answer in 20 words for each part.

Total marks: 10

Section-B: 10 questions, 02 question from each unit, 05 questions will be attempted, taking one from each unit, answer approximately in 250 words.

Total marks: 50

Section-C: 04 questions (question may have sub division) covering all units but not more then one question from each unit, descriptive type, answer in about 500 words, 02 question to be attempted.

Total marks: 40

Unit-I

Discovery of Muon, mesons, pions, nucleon interaction and isospin analysis, Discovery of resonances and stranger particles, Gell-Mann Nishima Scheme, K-decays, strangeness oscillation and Ko regeneration phenomenon, Discovery of j/p Si Particles, charm and bottom flavours.

Qualitative ideas of interactions, QED, QCD weak interaction, Addition conservation laws, Charge, colour, Baryon number, lepton number, flavour etc. and particle decays.

Unit-II

Invariance and operators in Quantum mechanics, Translations and rotations, Parity, tests of Parity conservation, charge conjugation invariance, eigen state of charge conjugation operators, Positronium decay, Experimental taste of E-invariance, Time reversal invariance, Tests of CPT invariance, SU (2) of isospin, Isospin of two nuclear system, isospin for antiparticles C-party, SU (3) (colour and flavour), quark-antiquark states, mesons, 3 quark states, Baryons magnetic moment, Heavy quark: charm and beyond, Hardon masses colour factors.

Unit-III

Non-relativistic time dependent perturbation theory, Rules for scattering amplitudes in Feynmann-Struckelberg approach cross section in terms of invariant amplitude M variables, Decay Rates in terms of M invariants, An electron interacting in field, calculating, cross section for $e^+e^- \rightarrow e^+e^-$ Moller scattering and e.m. scattering arid process $e^+e^- \rightarrow e^+e^-$. Helicity conservation of high energies in lab frame, Kinematice relevant to the parton model.

Unit-IV

Photons and their polarization vectors propagators of (I) Spinless particles (II) electron (III) photon, The prescription for propagators, summary of Feynmann rules for QED, producing a charge distribution with electrons, form factors, e-p scattering ep-ex formalism for analyzing as (Virtual) photon-proton, total cross section and Bjorken scaling, Quarks with in the proton gluons.

Unit-V

Classification of weak interactions: Nuclear Decay, Fermi theory, Inter partition of coupling, G-parity violating and V-A form of weak current Cobalt-60 experiment, Parity violation in B-decay, Experimental determination of neutrino helicity, Lepton helicities in pion and muon-decay, weak decays of strange particles: Cabibbo theory, Quantitative ideas about discovery of W^\pm and Z^0 .

OR

Paper VIII- (C) Solid State Electronics

Duration:- 3hrs

Marks:-100

Note-: - The question paper will contain three section as under-

Section-A: One compulsory question having 10 parts with 02 parts from each unit, short answer in 20 words for each part. **Total marks: 10**

Section-B: 10 questions, 02 question from each unit, 05 questions will be attempted, taking one from each unit, answer approximately in 250 words. **Total marks: 50**

Section-C: 04 questions (question may have sub division) covering all units but not more then one question from each unit, descriptive type, answer in about 500 words, 02 question to be attempted. **Total marks: 40**

Unit-I

Semiconductor Physics: Energy band diagrams of actual semiconductors likes Si, Ge and GaAs, impurity doping and impurity energy levels, Calculation of Fermi level and conductivity of semiconductors, Injection of carriers, diffusion, Drift and continuity equation (band to band), trap assisted and Auger recombination, low injection and high injection, quasi Fermi levels.

Unit-II

Poly crystalline and Amorphous Semiconductors: Semiconductor surfaces, surface charge and surface barrier, poly crystalline semiconductor, properties of grain boundaries, poly silicon as gate material, electrical conduction in amorphous semiconductors, mobility edge band, details and dangling band States.

Unit-III

Semiconductor Diodes: PN junction, Depletion region capacitance, current voltage relation, recombination in space charge region and diode ideality factor, junction breakdown and avalanche multiplication, a-c response, diffusion capacitance, switching properties, reverse recovery, PINB diode hetro junctions, metal semiconductor barrier, Schottky thermionic and diffusion currents and measurement of barrier height.

Unit-IV

Bipolar Transistors and Thyristors: General characteristics of Bipolar junction transistors, voltage rating, factors controlling current gain, frequency performance, power transistors, switching of bipolar transistor, basic concept of PNP structures, thyristor's turn on, turn off and power consideration triacs.

Unit-V

JFETS, MESFETS and MOSFETS: JFET modeling including saturation velocity effects, GaAs MESEFT, MOS diodes, surface space charge regions, surface states, MOSEFT, surface space charge region under no equilibrium condition channel conductance, basic characteristics, current voltage and device parameters.

M.Sc. Final Practical Physics

Time 12 hrs.

Marks: 200

Note: There will be two experiments of 6 hour duration each for two days. The distribution of marks will be as follows.

(A) Two experiments	125marks
(B) Record	25 marks
(C)Viva voce	25marks
(D) Seminar	25 marks

(Write-up with references are to prepared & submitted during exam)

Total -

200 marks

List of Experiments:

1. Determine fine structure constant using sodium doublet
2. Verify Cauchy's relation & determination of constants.
3. To determine e/m for an electron by Zeeman effect.
4. Determine the dissociation energy of Iodine molecule.
5. Study the characteristics curve of klystron.
6. Determine the dielectric constant of turpentine oil with the help of Lecher wire system.
7. Determination of energy of a given ray from Re-De source.
8. Find out the percentage resolution of given scintillation spectrometer using Cs-137.
9. Find out the energy of a given X-ray source with the help of a scintillation spectrometer.
10. Plot the Gaussian distribution curve for a radioactive source.
11. To study the frequency and phase characteristics of band phase filter.
12. Study the wave from characteristics of transistorized a stable symmetrical multivibrator using CRO & determines its frequency by various C & R.
13. Artificial transmission line.
14. To study the mode characteristics of reflex klystron and hence to determine mode number, Transmit time, Electronic, Tuning range, electronic tuning sensitivity.
15. To study the E-plane radiation of pattern of pyramidal horn antenna and compute the beam width of the antenna.
16. To study the H-plane radiation of pattern of pyramidal horn antenna and compute the Directional gain of the antenna.
17. Determine the electric constant of a given sample at Microwave frequency.
18. Determine the electric constant of a Benzene using plunge technique at room temperature.
19. To determine the unknown impedance using slotted line section smith chart in the K-band.
20. To study the Microwave absorption in dielectric sheets.
21. To determine the e/m of an electron by magnetron valve method.
22. To determine the velocity of waves in water using ultrasonic interferometer.

23. To determine the magnetic susceptibility of two given samples by Gouy's method.
24. Determination of Land's 'g' factor for IRRH crystal using electron spin Resonance spectrometer.
25. To determine e/k using transistor characteristics.
26. To study dark and illumination characteristics of p-n junction solar cell and to determine (i) its internal series resistance (ii) Diode ideality factor.
27. To study the characteristics of following semiconductor devices (i) VDR (ii) Photo transistor (iii) Thermistor (iv) IED
28. To study the characteristics of MOSTET and MOSFET amplifier.
29. To study dark and illumination characteristics of p-n junction solar cell and to determine its.(i) maximum power available (ii) Fill factor.
30. Any other experiments of the equivalent standard can be set.
